

1) NAME THE CAPABILITY: What do you want to develop or demonstrate?

- a. I would like to develop my software development skill with this project. So ideally, I would be able to work on software and follow the correct agile principles, shipping development and finally production software.
- b. One thing I have thought would be cool to start working on is integrating Machine Learning and AI to game enemy NPCs. So, like a training bot that will get better based on player movement to help train the player to be better at the game. Even to incorporate the pro level play to train against other pros movement to increase their ability.

2) NAME THE EXPERIENCE: What work would allow you to practice it?

- a. I would like to work for a software development company or a game development company that is looking to use AI or ML for their software.
- b. I am looking to be in the builder pathway. I have a very solid understanding in the tech leader and architect pathways but would like to branch more to writing code.

3) NAME THE ACHIEVEMENT: Answer the, "So what?" Why would an employer care you have this experience?

- a. With my extensive background as a System and Network Administrator this experience would allow me to better bridge the differences in priorities or the miscommunications between the architect roles (those setting up the inventory, purchasing the equipment, etc. and the builder roles to design software, website, or applications that can scale based off current and future hardware.
